

# Improved Outcomes in mCRPC with PSMA-Directed Diagnostics and Therapies

This transcript has been edited for style and clarity and includes all slides from the presentation.

This activity is provided by

# Improved Outcomes in mCRPC with PSMA-Directed Diagnostics and Therapies

Ayse Tuba Kendi, MD and Oliver Sartor, MD

- ▶ **Ayse Tuba Kendi, MD:**  
Hello, and welcome to this educational activity, entitled “*Improved Outcomes in Metastatic Castration-Resistant Prostate Cancer With PSMA-Directed Diagnostics and Therapies.*”

## Faculty Introductions

<b>Ayse Tuba Kendi, MD</b> Professor in Radiology Mayo Clinic Rochester, Minnesota	<b>Oliver Sartor, MD</b> Medical Director Tulane Cancer Center Associate Dean for Oncology Tulane University New Orleans, Louisiana
---	--

The slide has a light gray background with a blue footer. The 'AXIS Medical Education' logo is in the bottom left corner.

- ▶ I am Dr. Ayse Tuba Kendi, Professor in Radiology at Mayo Clinic in Rochester, Minnesota. I'm joined today by Dr. Oliver Sartor, Medical Director at Tulane Cancer Center and Associate Dean for Oncology at Tulane University in New Orleans, Louisiana.

## Disclaimer and Disclosure

### DISCLAIMER

- Participants have an implied responsibility to use the newly acquired information to enhance patient outcomes and their own professional development. The information presented in this activity is not meant to serve as a guideline for patient management. Any procedures, medications, or other courses of diagnosis or treatment discussed or suggested in this activity should not be used by clinicians without evaluation of their patients' conditions and possible contraindications or dangers in use, review of any applicable manufacturer's product information, and comparison with recommendations of other authorities.

### DISCLOSURE OF UNLABELED USE

- This activity may contain discussion of published and/or investigational uses of agents that are not indicated by the FDA. The planners of this activity do not recommend the use of any agent outside of the labeled indications.
- The opinions expressed in the activity are those of the faculty and do not necessarily represent the views of the planners. Please refer to the official prescribing information for each product for discussion of approved indications, contraindications, and warnings.

- ▶ First, disclaimer and disclosure, indicating that we may be discussing off-label use of approved agents or agents that are in development.

## Disclosure of Conflicts of Interest

## Learning Objectives

Upon completion of this activity, participants should be better able to:

- Describe the clinical significance of the background and use of PSMA-based imaging for PET/CT for diagnosis of mCRPC
- Evaluate clinical trial data and research findings in the determination of best-practice selection and sequencing of available and emerging treatment modalities for patients with mCRPC
- Recognize the potential application of both PSMA-directed PET for diagnostics and PSMA-directed RLT for treatment
- Identify patients most likely to benefit from a theranostic approach to slow tumor progression
- Apply strategies to identify and manage adverse events associated with PSMA-targeted therapies for mCRPC
- Summarize the potential impact of QoL improvements and other clinical challenges in patients with heavily pretreated mCRPC

CT, computed tomography; mCRPC, metastatic castration-resistant prostate cancer; PET, positron emission tomography; PSMA, prostate-specific membrane antigen; QoL, quality of life; RLT, radioligand therapy.

► Here are learning objectives for this activity.

## Overview of Theranostics, PSMA, and PSMA Imaging

Dr. Tuba Kendi

PSMA, prostate-specific membrane antigen.

► I'll start today by reviewing theranostics, prostate-specific membrane antigen or PSMA, and PSMA imaging in prostate cancer.

## Outline

- Discuss concept of thera(g)nostics
- Understand appropriate use of PSMA agents
- Compare PSMA imaging agents
- Understand role of PSMA imaging before RLT
- Review of alpha emitters

► The outline of my talk will be discussion of concept of theranostics, or theragnostics. We will talk about appropriate use of PSMA agents. We will compare PSMA imaging agents and understand role of PSMA imaging before radioligand therapy. And I will also do a brief review about alpha emitters.

PSMA, prostate-specific membrane antigen; RLT, radioligand therapy.

## What is Thera(g)nostics?

Theranostic combines the words “therapy” and “diagnostics”

Hofman et al. *Radiographics* 2015;35:500-516. Frangos and Buscombe *Eur J Nucl Med Mol Imaging* 2019;46:519.

► First, what is theranostics or theragnostics? It is actually combination of two words—therapy and diagnostics. Which term is better? In a recent article, the authors asked the same question to a great linguistics professor, Dr. Babiniotis. According to Dr. Babiniotis, theragnostics is the better word to use, as linguistically it is the actual combination of therapy and diagnostics. In word theranostics, thera means hunting, not therapy. I also asked this question to one of

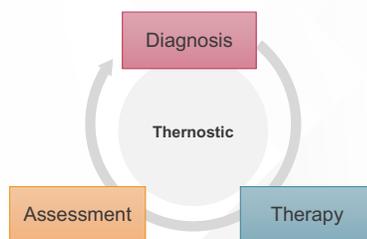

my colleagues from medical oncology, Dr. Leventakos. He is originally from Greece. He mentioned that thera is the name of an island, also known as Santorini Island. And theranostics may mean a disease of Santorini Island, as well.

We continue to use both terms, and actually theranostics more than theragnostics. Maybe it is easier to say, or we get used to that term more. How it works. First, you need a vector that could identify the tumor.

This is mostly done by having a small peptide or a ligand that can identify targets, receptors, over-populated, or more specific to the tumor. By attaching this peptide to an imaging radionuclide, you form the imaging vector. If patient has abundance of tumor cells that could be identified by this imaging vector, you can consider treating patients with a therapy vector. This time, you have a radionuclide attached to the peptide or ligand, with high energy that will destroy the tumor cell.

## Thera(g)nostics (from imaging to therapy)

If you can see it,  
you can treat it

- ▶ Overall, you can define this concept simply as, “you treat what you see.”

## Prostate Cancer

### Introduction

- Most common cancer diagnosed in men in the United States
  - Approximately 268,490 men will be diagnosed with prostate cancer in 2022
  - About 1 man in 8 will be diagnosed with prostate cancer during his lifetime
- The second most common cause of cancer mortality in the United States is from metastatic, castrate-resistant prostate cancer that no longer responds to hormonal therapy
  - About 34,500 men will die from prostate cancer

- ▶ Let's briefly talk about prostate cancer. Prostate cancer is the most common cancer diagnosed in men, and second leading cause of cancer mortality in U.S.

## Prostate Cancer

### Current treatment landscape

- Radical prostatectomy or radiotherapy (local disease)
- Hormonal therapy (androgen deprivation)
- Enzalutamide and abiraterone (androgen receptor inhibitors)
- Chemotherapy (docetaxel/cabazitaxel) + prednisone
- Sipuleucel-T (cell-based immunotherapy)
- Radium-223 (alpha particle-emitting radioactive therapeutic agent)

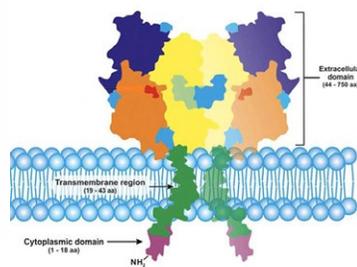

Schaeffer et al. NCCN Clinical Practice Guidelines in Oncology (NCCN Guidelines®). Prostate cancer. V.4.2022. [https://www.nccn.org/professionals/physician\\_gls/pdf/prostate.pdf](https://www.nccn.org/professionals/physician_gls/pdf/prostate.pdf)

▶ Currently available treatment landscape includes radical prostatectomy and radiation therapy when disease is local, hormonal therapy with androgen deprivation during hormone-sensitive periods. Chemotherapy, androgen receptor pathway inhibitors, immunotherapy, radium-223, PARP inhibitors, are other forms of therapies, mainly used at castration-resistant, advanced stages. Unfortunately, these therapies, including chemotherapy, have survival benefit less than 5 months in advanced metastatic castration-resistant prostate cancer stage. In addition, chemotherapy comes with significant side effects, and it is not a walk in the park for patients. There is an urgent need for more effective therapies, especially at metastatic castration-resistant stage.

## Prostate-Specific Membrane Antigen

- A glutamate carboxy peptidase/folate hydrolase cell surface enzyme
- Overexpressed on the surface of prostate cancer cells (up to 100-1000 fold)
- **Highly attractive target for imaging and therapy**

Evans et al. *Br J Pharmacol*. 2016;173:3041-3079.

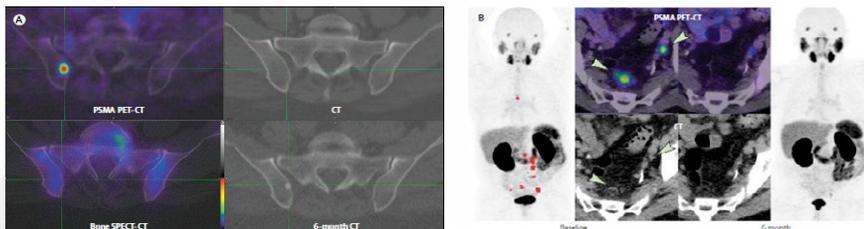

▶ Concept of theranostics works best when there is a specific target, and PSMA is a great example for that. PSMA is a cell surface enzyme, also called glutamate carboxypeptidase, or folate hydrolase and it is overexpressed at most of prostate cancer cells. PSMA mostly has no expression at normal tissues, which is a great advantage. That is why PSMA is a highly attractive target for both imaging and therapy. PSMA imaging and therapy work with lock and key system. PSMA ligand can identify PSMA receptor on the cell surface like a key. For imaging, you form a vector with an imaging agent like gallium-68 or F18. If there are cancer cells with PSMA expression, then you can use therapy vector, by using lutetium, a beta emitter with favorable characteristics for radionuclide therapy.

## Why PSMA Imaging?

- ▶ Let's now talk about why do we need PSMA imaging? What is the advantage over currently available conventional imaging, like CT?

AXIS  
Medical Education

## PSMA PET in High-Risk Prostate Cancer

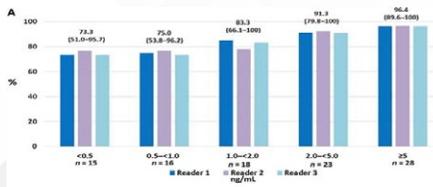

- ▶ According to a multi-center Australian-based study, called proPSMA, PSMA imaging performs with 27% more accuracy compared to conventional imaging. There is also less exposure to radiation, higher reported agreement, with greater treatment impact. As you can see from this example, PSMA imaging can identify sites of metastasis that are not identifiable at CT.

AXIS  
Medical Education

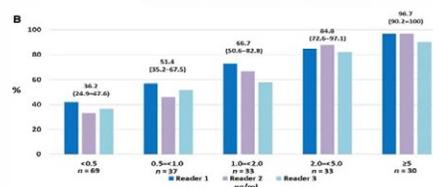

PET, positron emission tomography; PSMA, prostate-specific membrane antigen.  
Hofman et al. *Lancet* 2020;395:1208-1216.

## CONDOR Study: <sup>18</sup>F-DCFPYL-PET

Correct Localization Rate by Baseline PSA levels

Detection Rate by Baseline PSA levels

▶ Another recently published study, CONDOR, is a phase 3, single arm study assessing diagnostic performance and safety of PyL/PSMA/PET in patients with suspected biochemical recurrence, who were negative or equivocal at conventional imaging, including fluciclovine PET CT, C11 choline PET CT, MRI, CT and bone scan. Study population was 208 men. Correct localization rate, or CLR, was 85-87%. A change in management after PSMA PET CT was 63.9%. This image, from CONDOR study, shows correct localization rate, or CLR, and detection rate by baseline PSA levels for each group of three readers provided.

▶ Overall, we can come to conclusion that PSMA imaging has high detection rate and diagnostic accuracy, compared to conventional imaging. In addition, it results in more frequent change in management plan, and it is the imaging tool for assisting patients for eligibility for PSMA radioligand therapy.

## Benefit of PSMA Imaging

- High detection rate and diagnostic accuracy
- Results frequently result in changing management plans
- Assesses patients for eligibility for PSMA RLT

# Indications for PSMA PET

Clinical Scenarios for Prostate Cancer

Scenario #	Description	Appropriateness	Score
1	Patients with suspected prostate cancer (e.g., high/rising PSA levels, abnormal digital rectal examination results) evaluated for targeted biopsy and detection of intraprostatic tumor	Rarely Appropriate	3
2	Patients with very low, low, and favorable intermediate-risk prostate cancer	Rarely Appropriate	2
3	Newly diagnosed unfavorable intermediate, high-risk, or very high-risk prostate cancer	Appropriate	8
4	Newly diagnosed unfavorable intermediate, high-risk, or very high-risk prostate cancer with negative/equivocal or oligometastatic disease on conventional imaging	Appropriate	8
5	Newly diagnosed prostate cancer with widespread metastatic disease on conventional imaging	May be Appropriate	4
6	PSA persistence or PSA rise from undetectable level after radical prostatectomy	Appropriate	9
7	PSA rise above nadir after definitive radiotherapy	Appropriate	9
8	PSA rise after focal therapy of the primary tumor	May be Appropriate	5
9	nmCRPC (M0) on conventional imaging	Appropriate	7
10	Post-treatment PSA rise in the mCRPC setting in a patient not being considered for PSMA-targeted radioligand therapy	May be Appropriate	6
11	Evaluation of eligibility for patients being considered for PSMA-targeted radioligand therapy	Appropriate	9
12	Evaluation of response to therapy	May be Appropriate	5

mCRPC, metastatic castration-resistance prostate cancer; nm, non-metastatic; PSA, prostate-specific antigen; PSMA, prostate-specific membrane antigen; PET, positron emission tomography.  
 Jadvar et al. J Nucl Med. 2022;63:59-68.

► Certain indications for PSMA PET CT is nicely summarized at Society of Nuclear Medicine Molecular Imaging, Appropriate Use Criteria, updated in March 2022. Main appropriate use areas are newly diagnosed unfavorable intermediate, high-risk patients, patients with biochemical recurrence after radical prostatectomy or radiation therapy, and for review of patients for eligibility for PSMA-targeted therapy. Now, we have support and guidelines to use PSMA imaging.

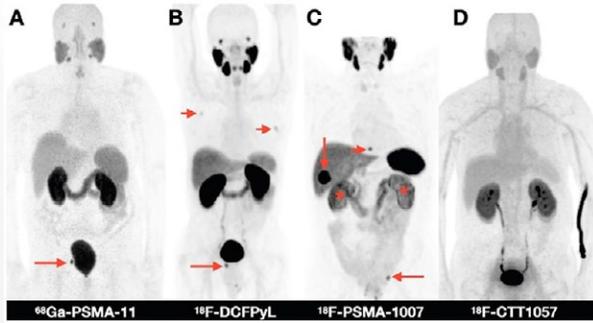

# PSMA Imaging Agents

Which One to Choose?  
 Do We Need to Choose?

► We need to decide which PSMA imaging agent to choose, or do we need to choose.

# PSMA Radiopharmaceuticals

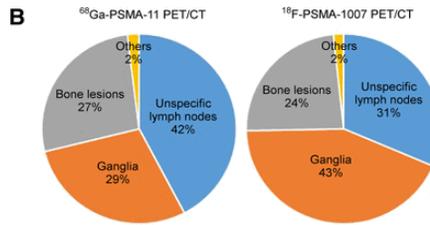

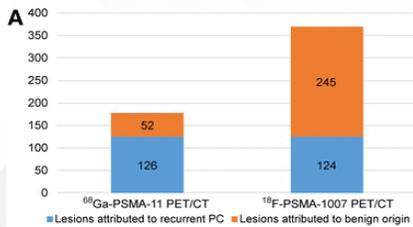

▶ There are PSMA imaging agents at clinical use, and at clinical trials or at development. Currently, gallium-68 PSMA-11, and F18 DCFPyL, PSMA PET are FDA-approved. Here, you see physiologic radiotracer distribution with different PSMA radionuclides. From these agents, PSMA-1007 shows minimal urinary bladder excretion, which could be a potential advantage to other PSMA agents.

PSMA, prostate-specific membrane antigen; Ga, Gallium; F, Piflutofolastat; F-DCFPyL, fluorine, 2-(3-[1-carboxy-5-[6-[18F]fluoro-pyridine-3-carbonyl)-amino]-pentyl]-ureido)-pentanedioic acid; F-CTT1057, fluorine cancer-targeted technology. Lawlin-Heath et al. *Radiology* 2021; 299:248-260.

# 68Ga-PSMA-11 vs 18F-PSMA-1007 PET

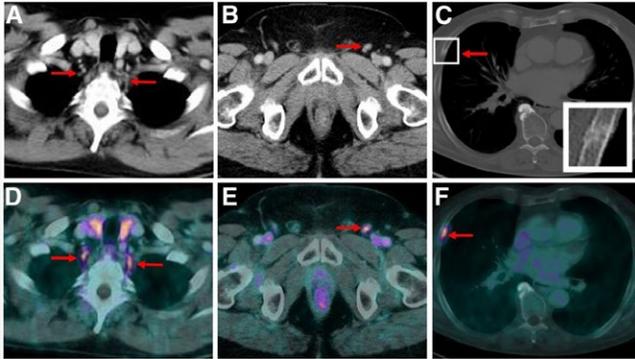

▶ However, F18 PSMA-1007 reported to have higher false positive rates compared to gallium-68 PSMA-11. There are more benign conditions with uptake at PSMA-1007, including bones, lymph nodes, and ganglia.

CT, computed tomography; Ga, Gallium; F, Piflutofolastat; PET, positron emission tomography; PSMA, prostate-specific membrane antigen; PC, prostate cancer. Rauscher et al. *J Nucl Med*. 2020;61:51-57.

## CT vs $^{18}\text{F}$ -PSMA-1007 PET

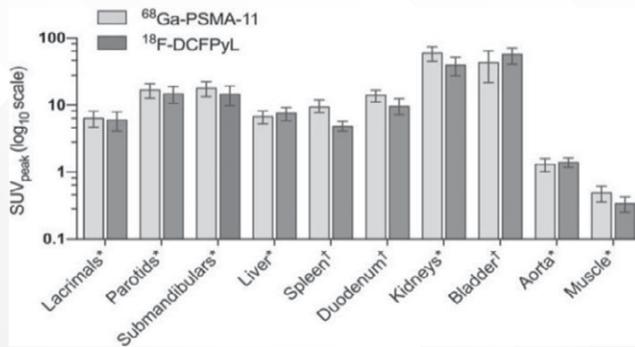

- ▶ In these images of PSMA-1007, you can see uptake at ganglia, inguinal lymph nodes, and ribs that are more pronounced or avid, that may cause false-positive results.

AXIS  
Medical Education

CT, computed tomography; PET, positron emission tomography; PSMA, prostate-specific membrane antigen. Rauscher et al. *J Nucl Med.* 2020;61:51-57.

## $^{68}\text{Ga}$ -PSMA-11 vs $^{18}\text{F}$ -DCFPyL

- ▶ Here is a figure from a study comparing gallium PSMA-11 to F18 DCFPyL. This study showed similar normal tissue distribution, with subtle differences between these two imaging agents.

AXIS  
Medical Education

Ga, Gallium; PSMA, prostate-specific membrane antigen; SUV, standardized uptake value. Ferreira et al. *Cancer Imaging* 2019;19(1):23.

## Choosing PSMA PET Agents

- All agents equally effective for assessing metastasis
- All agents equally effective as radiotracers for PSMA radioligand therapy

▶ Overall, where you look at the literature currently available, PSMA PET agents are equivalent to each other for metastasis assessment as well as for selection of patients for radioligand therapy.

PET, positron emission tomography; PSMA, prostate-specific membrane antigen. Jadvar et al. *J Nucl Med.* 2022;63:59-68.

## PSMA PET Imaging

How Do We Assess Patients for RLT Now?

▶ PSMA PET imaging – how do we assess patients for radioligand therapy now?

PET, positron emission tomography; PSMA, prostate-specific membrane antigen; RLT, radioligand therapy.

## <sup>177</sup>Lu-PSMA 617 Indication

- FDA approved, March 2022
- Patients with metastatic castration-resistant prostate cancer previously treated with taxane-based chemotherapy and androgen receptor pathway inhibitors

- ▶ Lutetium PSMA-617 has recently been approved by FDA for the treatment of metastatic castration-resistant prostate cancer patients, who have been previously treated with taxane-based chemotherapy and androgen receptor pathway inhibitors.

FDA, U.S. Food & Drug Administration; Lu, Lutetium; PSMA, prostate-specific membrane antigen.

## PSMA Imaging Results Criteria for Selection of Lu-PSMA 617 Therapy

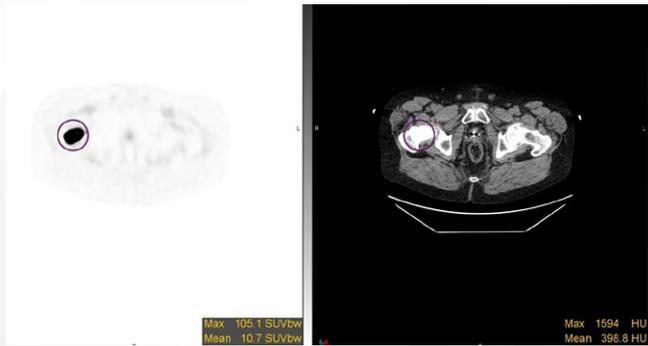

- Lu-PSMA 617 eligible: PSMA uptake greater than liver uptake in one or more metastatic lesions of any size in any organ
- Lu-PSMA 617 ineligible: PSMA uptake equal or lower than uptake in liver in any lymph node with short axis measuring at least 2.5 cm or in any solid organ with a lesion measuring at least 1 cm in the short axis
- 87% qualified by imaging criteria for enrollment in the VISION trial
- 13% did not qualify

- ▶ PSMA imaging selection criteria, used in phase 3 recent trial, has been accepted as imaging review criteria. The recent criteria define PSMA-positive disease as uptake greater than liver uptake in 1 or more metastatic sites. PSMA-negative is defined as PSMA uptake equal or lower than liver in any lymph node, with short axis of at least 2.5 centimeters, or solid organ lesion which showed excess of at least 1 centimeter.

Lu, Lutetium; PSMA, prostate-specific membrane antigen.

## PSMA-Positive Disease

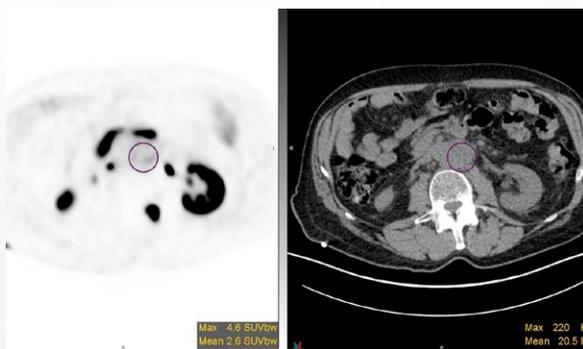

AXIS  
Medical Education

PSMA, prostate-specific membrane antigen.  
Slide courtesy of Dr. Ayse Kendi.

- ▶ Let's look at a couple examples. As you see, this patient has marked uptake and right femoral metastasis. The patient did not have any PSMA-negative metastasis; thus, he was eligible for therapy according to imaging criteria.

## PSMA-Negative Disease

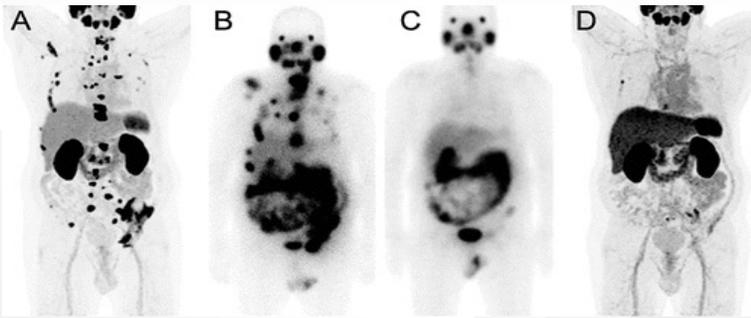

AXIS  
Medical Education

PSMA, prostate-specific membrane antigen.  
Slide courtesy of Dr. Ayse Kendi.

- ▶ However, this patient, who has a large PSMA-negative nodal metastasis, is not eligible according to imaging criteria.

## PSMA Therapy Response

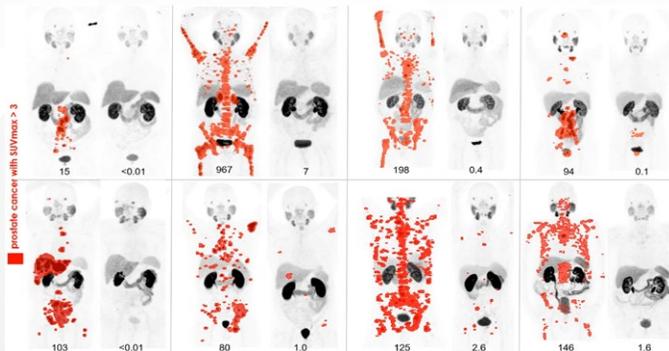

- ▶ Here is an example for a patient with excellent response to therapy. This is a 75-year-old, metastatic castration-resistant prostate cancer patient, treated with 6 cycles of lutetium PSMA therapy. Initial PSMA imaging, post-therapy imaging after first and sixth cycles, as well as follow-up PSMA imaging 4 weeks after completion of therapy show excellent response to therapy.

PSMA, prostate-specific membrane antigen.  
Lawrin-Heath et al. *Radiology* 2021;299:248-260.

## <sup>177</sup>Lu-PSMA-617 Treatment

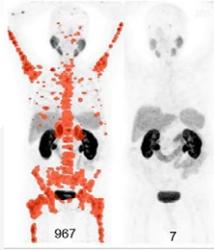

- ▶ This is the image from our Australian colleagues from Peter Mac, of patients before and after lutetium PSMA therapy. You see remarkable response in these patients after 3 months. This image was selected as image of the year at Society of Nuclear Medicine and Molecular Imaging annual meeting in 2018.

Lu, lutetium; PSMA, prostate-specific membrane antigen.  
Miyahira et al. *Prostate* 2020;80:1273-1296.

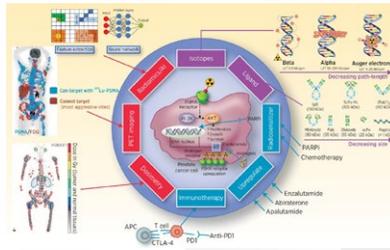

# PSMA Theranostics

## Current State

- High response rate
- Low toxicity
- Significant improvement of clinical symptoms
- Well-tolerated

## Potential Mechanisms to Optimize

- Given the large number of patients with metastatic prostate cancer, it is projected that 160,000 cycles of Lu-PSMA will be administered annually
- Discovery → Research → Education → Application

Lu, Lutetium; PSMA, prostate-specific membrane antigen. Miyahira et al. *Prostate* 2020;80:1273-1296; Kumar and Hofman. *Clin Cancer Res.* 2020;26:2774-2776.

► If we summarize, PSMA therapy has a high response rate with low toxicity, and significant improvement of clinical symptoms, with excellent tolerability by patients. Given high number of metastatic prostate cancer patients, expect that lutetium PSMA cycles per year at U.S. may reach to 150 to 160,000. To meet these demands in U.S., we need multiple, fully functioning theranostic centers.

What is the near future for lutetium PSMA therapy? Combination of radioligand therapy with other agents, like radio-sensitizers or immunotherapy. Another area is starting therapy at earlier stages, like before chemotherapy, and developing other therapy agents. These are a few items that I would like to mention that are in development.

## If Patients Don't Respond or Stop Responding to Beta Emitters, What's Next?

► What if patients don't respond or stop responding to beta emitters? What do we do now?

## Alpha Emitters vs Beta Emitters

### Alpha Emitter

- LET: 50-230 keV/microm
- Shorter range (less than 0.1 mm)
- Induces double DNA breaks
- Targets micrometastatic disease more efficiently

### Beta Emitter

- LET: 0-2 keV/microm
- Range is up to 2 mm
- Mostly induces single DNA breaks

DNA, deoxyribonucleic acid; LET, linear energy transfer.

▶ Although high response rates reported with lutetium PSMA, there are still about 30% of patients not responding, or developing resistance to beta emitter therapy. Could we consider alpha emitters, like actinium-225 for therapy? Yes. When you compare alpha emitters, they have higher energy, shorter range, they induce more double DNA breaks, and they can target micrometastasis more efficiently compared to beta emitters like lutetium.

## Alpha Emitters

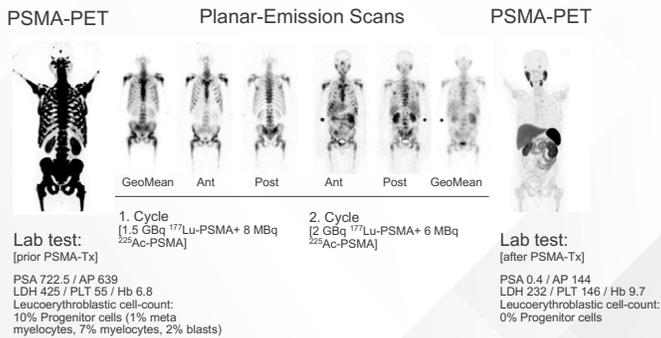

- Prior RLT failure (primarily due to progression of micrometastases)
- Diffuse bone marrow infiltration
- Limited availability
- Challenging radiochemistry
- Toxicity (salivary glands)

RLT, radioligand therapy.

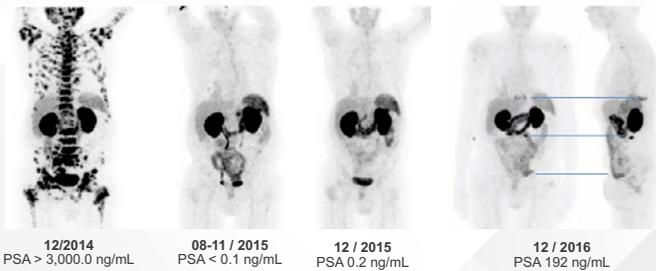

▶ Alpha emitters can be considered in patients with prior radioligand therapy failures, patients with diffuse bone marrow infiltration. However, limited availability, challenging radiochemistry, and toxicity are currently limiting factors.

## <sup>225</sup>Ac-PSMA Diffuse Type Red Marrow Infiltration

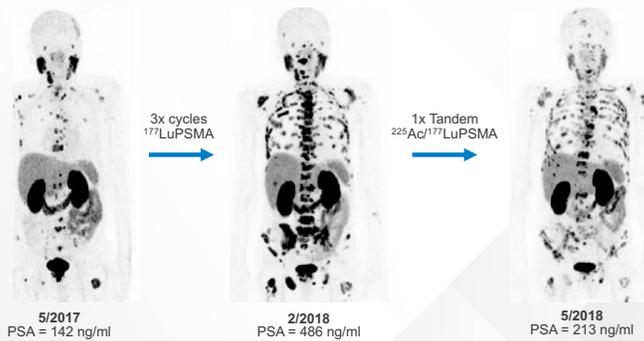

► Here is an example of a patient with response to actinium PSMA, who had refused red marrow infiltration. There is theoretical advantage regarding hematological toxicity compared to lutetium PSMA. However, severe xerostomia could be a major issue in alpha emitter treatment. This is an important limited side effect for alpha therapies.

## <sup>225</sup>Ac-PSMA Therapy

► This image shows a long duration of disease control in a patient with actinium PSMA therapy, suggesting promising result.

## Tandem Therapy (Ac-225-PSMA/Lu-PSMA-617)

AXIS  
Medical Education

Ac, actinium; Lu, lutetium.  
Kheish et al. *Eur J Nucl Med Mol Imaging* 2020;47:721-728.

► I would like to briefly mention about a retrospective study from Germany. In this study, authors shared a pilot experience from a small group of patients. They used tandem therapy in patients who are not responding to lutetium PSMA monotherapy. This study suggested that when lutetium PSMA is not effective alone, by using tandem therapy with low activity actinium-225 PSMA plus full activity of beta emitters, safely enhanced response to PRLT, while minimizing xerostomia. Here is an example for tandem therapy. Image A shows tumor spread before lutetium PSMA monotherapy. Image B shows progressive disease after three cycles of lutetium PSMA monotherapy. Image C shows partial remission after one cycle of actinium-225 PSMA and lutetium PSMA tandem therapy.

## PSMA-Directed RLT is Teamwork and Requires a Dedicated Multidisciplinary Team

- Urology
- Radiology/Nuclear Radiology
- Radiation Oncology
- Medical Oncology
- Surgery

AXIS  
Medical Education

PSMA, prostate-specific membrane antigen; RLT, radioligand therapy.

► Before conclusion slide, I would like to emphasize importance of teamwork for success at PRLT. PRLT truly requires multidisciplinary teamwork for success.

## Conclusions

- PSMA imaging is superior to conventional imaging
- PSMA imaging is appropriate for unfavorable intermediate and high-risk patients after RP or RT
- PSMA imaging results in appropriate selection for PSMA-directed RLT
- Current PSMA agents are comparable to each other
- $^{18}\text{F}$ -DCFPyL and  $^{68}\text{Ga}$ -PSMA-11 are FDA approved for PSMA-directed RLT, and are suitable for patient selection for RLT
- Alpha-emitters are appropriate for patients with diffuse bone marrow infiltration and following failure of prior beta emitter RLT

BM, bone marrow; FDA, US Food & Drug Administration; Ga, Gallium; PSMA, prostate-specific membrane antigen; RLT, radioligand therapy; RP, radical prostatectomy; RT, radiotherapy.

▶ PSMA imaging is superior to conventional imaging. Appropriate in favorable intermediate, high-risk patients, and biochemical recurrent after radical prostatectomy and radiation therapy. PSMA imaging is appropriate in selection for radioligand therapy. Current PSMA agents are comparable to each other for imaging. Currently FDA-approved  $^{18}\text{F}$  DCFPyL, and gallium-68 PSMA-11 are suitable for patient selection for radioligand therapy. Alpha emitters can be considered, especially at diffuse bone marrow infiltration and prior beta emitter radioligand therapy failure patients.

Now, we will hear from Dr. Sartor about radioligand therapy targeting PSMA.

## Radioligands Targeting PSMA: Challenges, Current Data, and Opportunities

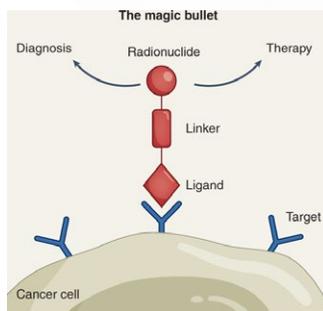

Dr. Oliver Sartor

▶ **Dr. Sartor:** Thank you, Dr. Kendi, and really a pleasure to be able to be here today. I'll be discussing the radioligands targeting PSMA, and I'm going to talk about some of the current challenges, the current data, and the opportunities.

## Theranostics: See it... Treat it

- Cell surface target
- A ligand
- A linker
- An isotope

► I think Dr. Kendi covered very nicely what theranostics represents today. And if I were going to simplify it, I would simply say the ability to use a ligand, a linker, and a radionuclide for either diagnosis or therapy. She covered very nicely about how we can use imaging to predict the presence of a target, and that presence of a target can then be potentially translated into therapy using a radionuclide.

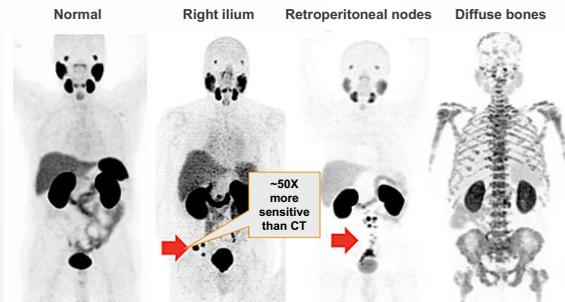

## Some Targets of Note

- SST2R (NETs)-proven success with isotopes
- ➔ PSMA (prostate)-proven success with isotopes
- CD19 (leukemia/lymphoma)-proven success with CAR-T
- CD37 (lymphoma)
- HER2 (breast)-notable recent success with new ADC
- HK2 (prostate)-interesting new target
- IGFR-1 (multiple)
- FAP (huge number of tumors for a stromal target)
- MC1R (melanoma)
- CA IX (renal)

► So, this is a really exciting area, right now, and one of the things I wanted to make sure that people were aware of is that PSMA is just one of the many targets that are under discussion in the theranostics field. I think we have lots of experience with neuroendocrine cancers, and in particular, those agents that target somatostatin type 2 receptors. And here we have proven success and FDA approvals. In addition, there are a whole variety of other targets that have been discussed—CD37, HER2/neu, HK2 in prostate insulin-like growth factor 1, fibroblast activated protein, or FAP CA9 in renal, and more.

## PSMA PET (Molecular Imaging): A Disruptive Force Across the Spectrum of Prostate Cancer

AXIS  
Medical Education

CT, computed tomography; PET, positron emission tomography; PSMA, prostate-specific membrane antigen.  
Courtesy of Oliver Sartor, MD.

- ▶ Now, in the theranostics paradigm, Dr. Kendi covered PSMA PET, and this molecular imaging is really a disruptive force across the spectrum of prostate cancer. FDA approved in the context of either high risk disease at the time of diagnosis, or recurrent disease after a definitive therapy— either radical prostatectomy or radiation.

## PSMA PET Imaging Is Redefining Staging for All Manner of Prostate Cancer Patients (both at diagnosis and in the recurrent setting)

FDA approvals for 18F-DCFPyL and 68Ga-PSMA-11 in 2021

AXIS  
Medical Education

FDA, US Food & Drug Administration; Ga, Gallium; PET, positron emission tomography; PSMA, prostate-specific membrane antigen.

- ▶ We also know that it can serve as a predictive biomarker in terms of systemic therapy, with things like PSMA lutetium. So the whole concept of PSMA theranostics is built around seeing the tumor, treating the tumor, and understanding the diversity. Now, as Dr. Kendi mentioned, there is a little more to the story, because not every tumor is PSMA PET-positive. Nevertheless, it's a key tenet in our field. If you're going to treat with PSMA, you ought to be able to see it with PSMA PET. Now, we all know about the FDA approvals for DCFPyL and PSMA-11, either F18 or gallium-68, and this really sets the stage for the molecularly targeted isotopic therapy.

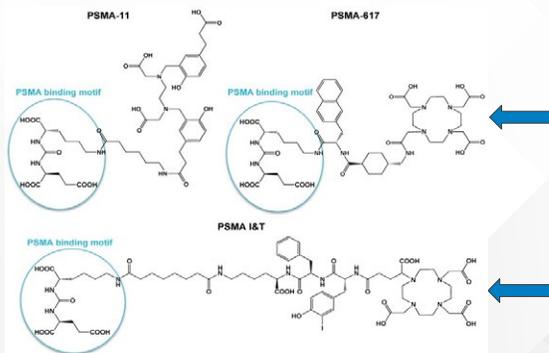

# Molecularly Targeted Isotopic Therapy

Small molecules, peptides, antibodies, minibodies, aptamers, and radionuclides

- ▶ And we have small molecules, there's also a lot of discussion around peptides, and antibodies, and maybe minibodies, and even naked radionuclides. So, there's a lot to talk about when it comes to this broad field of therapeutic aspects of theranostics.

## PSMA Binding Ligands Can Be Linked to Therapeutic Agents via a Chelator

- ▶ The PSMA binding ligands that we're going to be particularly discussing are PSMA-617 and PSMA-I&T, and both of these are being used therapeutically. Both of them have a chelator to which you can attach a therapeutic agent, and this therapeutic agent may be something like lutetium or actinium, and this ability to target the PSMA expressions, of course is critically important.

PSMA, prostate-specific membrane antigen; I&T, imaging and therapy.  
Chatalic et al. *Theranostics* 2016;6:848-861.

## Large Number of Beta Emitters in Human Studies

Radionuclide	Half-life	Maximum Energy (MeV)	Mean Energy	Average Penetration
Strontium-89	50.5 days	1.46	0.58	2.4 mm
Samarium-153	1.9 days	0.81	0.22	0.5 mm
Phosphorus-32	14.3 days	1.71	0.69	3.0 mm
Yttrium-90	2.7 days	2.27	0.93	4.0 mm
Lutetium-177	6.7 days	0.49	0.14	0.3 mm
Iodine-131	8.0 days	0.61	0.19	0.8 mm
Rhenium-186	3.8 days	1.07	0.33	1.0 mm
Rhenium-188	0.7 days	2.12	0.64	3.8 mm
Holmium-166	1.1 days	1.84	0.67	3.3 mm
Tin-117m*	13.6 days	0.15	0.14	0.2 mm

**AXIS**  
Medical Education

\* Conversion electron

► Now, there are actually a lot of beta emitters in human studies. Lutetium is the one we're going to focus on today, but there's also been already a mention of alpha emitters, such as actinium, and I'm going to cover a little bit about alpha emitters as well. Within the large number of beta emitters currently in human study, things like strontium-89, samarium-153, are actually FDA-approved for bone metastatic prostate cancer and for palliation, but they don't prolong survival. On the other hand, the PSMA lutetium-177 does prolong survival, and that's very, very important.

## PSMA Targeted Therapy: The Beginning

### Radiation Dosimetry and First Therapy Results with a <sup>124</sup>I/<sup>131</sup>I-labeled Small Molecule (MIP-1095) Targeting PSMA for Prostate Cancer Therapy

Christian M Zechmann, Ali Afshar-Oromieh, Tom Armor, James B Stubbs, Walter Mier, Boris Hadaschik, John Joyal, Klaus Kopka, Jürgen Debus, John W Babich, Uwe Haberkorn

### PSMA-Based Radioligand Therapy for Metastatic Castration-Resistant Prostate Cancer: The Bad Berka Experience Since 2013

Harshad R. Kulkarni, Aviral Singh, Christiane Schuchardt, Karin Niepsch, Manal Sayeg, Yevgeniy Leshch, Hans-Juergen Wester and Richard P. Baum

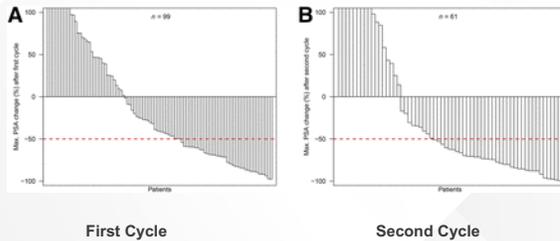

**AXIS**  
Medical Education

PSMA, prostate-specific membrane antigen.  
Zechmann et al. *Eur J Nucl Med Mol Imaging* 2014;41:1280-1292; Kulkarni et al. *J Nucl Med*. 2016;57(suppl 3):97S-104S.

► Now, if we were to go back to the beginning of PSMA-targeted therapy, it actually starts with a small molecule called MIP-1095. And MIP-1095 doesn't bind lutetium, it actually binds iodine. And the therapeutic aspects of this molecule were being addressed with I-131, in some early studies in Germany. And what I'll say is this helped get the field rejuvenated and excited about moving forward.

## German Multicenter Study Investigating <sup>177</sup>Lu-PSMA-617 Radioligand Therapy in Advanced Prostate Cancer Patients

Optimal dose and schedule not established

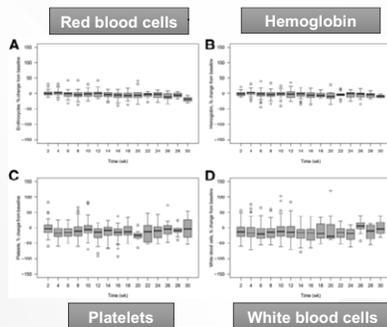

► And then, the first lutetium-based therapies were actually done at Bad Berka by Richard Baum, and he published his experiences going way back to 2013. So, even though it may appear as though PSMA-based theranostics is new, this work has been ongoing for a number of years, and in particular, since 2013.

In the German experience, I think it was very valuable to be able to compile a whole series of German centers, and to publish their data as a whole. And here, you see Kambiz Rahbar senior author Bernd Krause, looking at first cycle PSA declines, second cycle PSA declines, on a whole wide variety of doses and schedules. And what you can see is you've got a lot of patients that are responding, of course some that do not.

<sup>177</sup>Lu-PSMA, Lutetium-177-prostate-specific membrane antigen. Rahbar et al. *J Nucl Med.* 2017;58:85-90.

## German Multicenter Study Investigating <sup>177</sup>Lu-PSMA-617 Radioligand Therapy in Advanced Prostate Cancer Patients

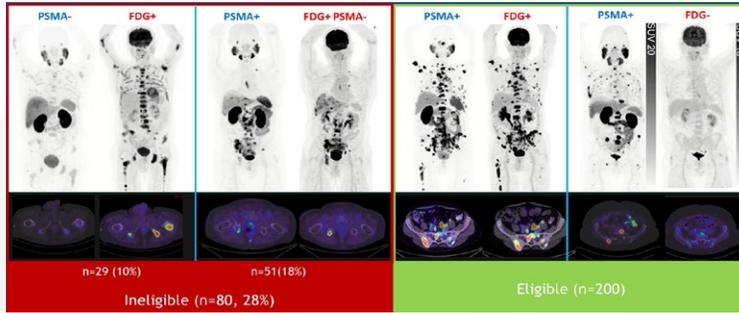

► One of the other interesting things about these early German studies was the fact that there was very little myelosuppression. The concern over using lutetium was that you would damage the bone marrow. But here, on this slide, from the *Journal of Nuclear Medicine* article in 2017, you can see that platelets, red cells, white cells, really do not suffer much in the way after this therapy, so that was a very important finding.

<sup>177</sup>Lu-PSMA, Lutetium-177-prostate-specific membrane antigen. Rahbar et al. *J Nucl Med.* 2017;58:85-90.

## Patient Selection in Australian PSMA 617 Trials: PSMA and FDG PET/CT

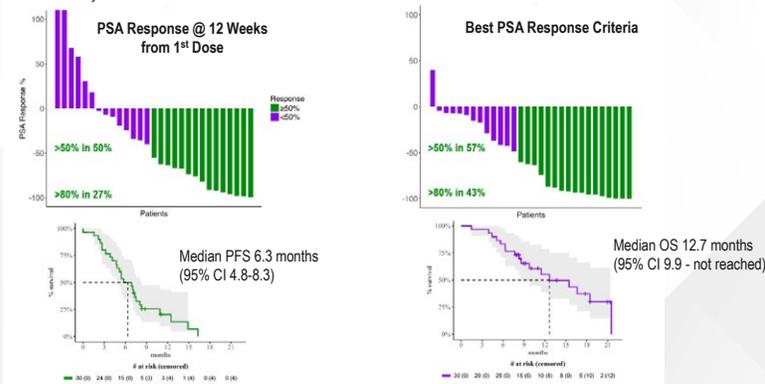

► Now, next—a hats off to the Australian group based at Peter Mac, partly led by Michael Hofman, but a number of very important collaborators at Peter Mac began to prospectively explore the PSMA-617 lutetium. They chose their patients in a way that was a little more complex than just using PSMA uptake. They were also looking at FDG uptake and looking for concordance and discordance. If the PSMA was positive, and there was no FDG uptake, well that patient was fine. If the FDG was positive, and there was no PSMA, well that patient would not be treated with a PSMA ligand. And if there was discordance between the scans, then the eligibility was in question, and typically for those individuals with FDG-positive lesions that were PSMA-negative, they did not want them to go on study.

PSMA, prostate-specific membrane antigen; FDG PET/CT, fluorodeoxyglucose-positron emission tomography. Hofman et al. *J Clin Oncol.* 2020;38(15):5500.

## LuPSMA Trial: <sup>177</sup>Lu-PSMA-617 in a Single-arm, Single-center, Phase 2 Trial

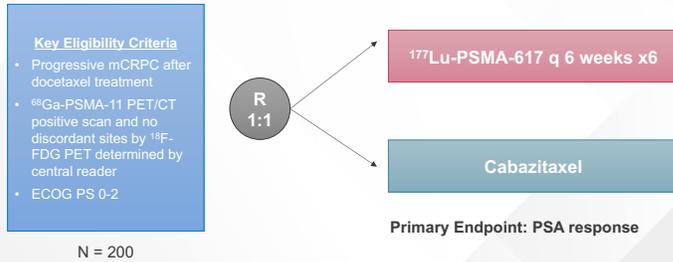

► This is the original prospective phase 2 data, and you can see that on the left-hand side, PSA response—12 weeks from the first dose is really quite good. The best PSA response is very strong. Median time to progression was about 6.3 months, and that's quite good. This was an important study, defining the dose that was given, treating patients in a prospective manner.

<sup>177</sup>Lu-PSMA, Lutetium-177-prostate-specific membrane antigen; OS, overall survival; PFS, progression-free survival; PSA, prostate-specific antigen. Adapted from Hofman et al. *Lancet Oncol.* 2018;19:325-333.

## TheraP Trial: Randomized Phase 2 Trial Comparing Cabazitaxel to <sup>177</sup>Lu-PSMA-617 (ANZUP 1603)

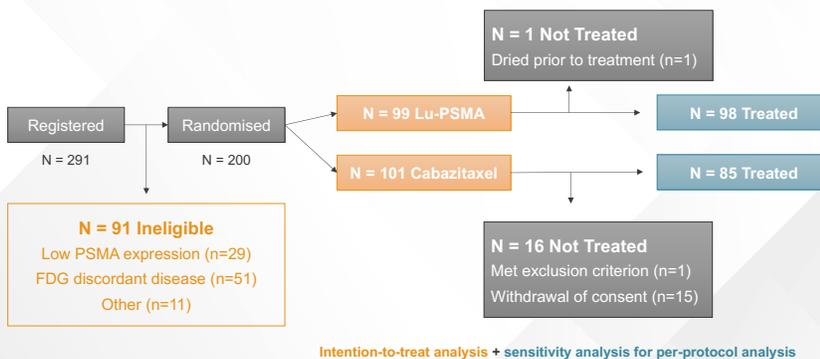

▶ That, in turn, led the Australians to go to another trial. This was a randomized phase 2, that they call the TheraP trial. And here, they took individuals who were PSMA PET-positive, did not have FDG discordant lesions, all of whom had progressed after docetaxel and a novel hormone, and randomized them to either lutetium or the cabazitaxel, the primary endpoint of PSA response.

<sup>68</sup>Ga, gallium-68; <sup>177</sup>Lu, lutetium-177; CT, computed tomography; ECOG PS, Eastern Cooperative Oncology Group performance status; FDG, fluorodeoxyglucose; mCRPC, metastatic castration-resistant prostate cancer; PET, positron emission tomography; PSA, prostate-specific antigen; PSMA, prostate-specific membrane antigen.  
Hofman et al. *BJU Int.* 2019;124:5-13.

## TheraP Trial: CONSORT Diagram for Key Details

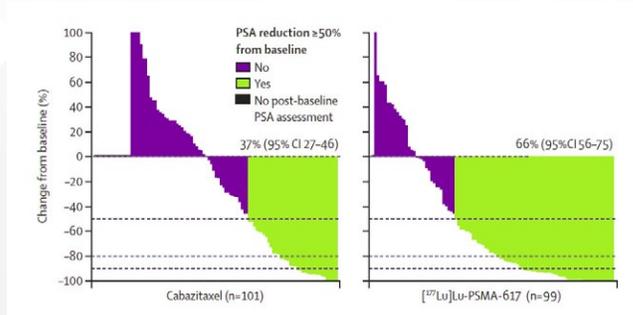

▶ Well, it turned out that using the selection criteria in this particular trial, that they screened 291 patients to enroll 200, but 91 patients were excluded, either for low PSMA expression or FDG discordant disease, or a few other reasons. But you can see that low PSMA expression, in 10%–29 out of 291, and FDG discordant disease—51 out of 291—so there’s a significant number of patients excluded from this particular trial.

Lu, lutetium; PSMA, prostate-specific membrane antigen; FDG, fluorodeoxyglucose.  
Hofman et al. *J Clin Oncol.* 2020;38(15):5500.

## [<sup>177</sup>Lu]Lu-PSMA-617 versus cabazitaxel in patients with metastatic castration-resistant prostate cancer (TheraP): a randomised, open-label, phase 2 trial

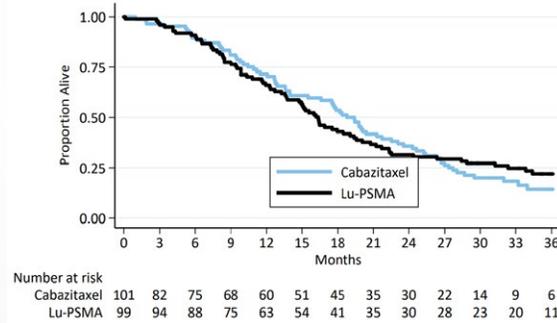

► Now, this data has now been published in *Lancet* 2021, and you can see in this TheraP trial that there is a superiority of the PSA declines, with regard to PSMA lutetium, as compared to cabazitaxel.

<sup>177</sup>Lu, Lutetium-177; PSA, prostate-specific antigen; PSMA, prostate-specific membrane antigen. Adapted from Hofman et al. *Lancet* 2021;397:787-804.

## Survival in TheraP After 3 Years

- HR 0.97
- (95% CI, 0.70-1.4)
- $P = .99$
- Median not stated but approximately 17 months for <sup>177</sup>Lu-PSMA and approximately 20 months for cabazitaxel

► But what we also know, very recently and presented at ASCO 2022, is that the survival between cabazitaxel and lutetium were essentially identical. Now this is a phase 2 trial. It's not really intended to be able to assess survival, and if you wanted to do formal trials for survival, you really would need larger numbers. But nevertheless, you can see in this particular trial after 3 years, that there really was not a distinction between the survival—between the lutetium PSMA and the cabazitaxel. Now, I will say that there was less side effects with the PSMA lutetium, and the authors concluded that the PSMA lutetium is preferable, given the superior adverse event profile.

<sup>177</sup>Lu, Lutetium-177; PSMA, prostate-specific membrane antigen. Hofman et al. *J Clin Oncol*. 2022;40(16):5000.

# Lutetium-177–PSMA-617 for Metastatic Castration-Resistant Prostate Cancer

The NEW ENGLAND JOURNAL of MEDICINE

ORIGINAL ARTICLE

## Lutetium-177–PSMA-617 for Metastatic Castration-Resistant Prostate Cancer

O. Sartor, J. de Bono, K.N. Chi, K. Fizazi, K. Herrmann, K. Rahbar, S.T. Tagawa, L.T. Nordquist, N. Vaishampayan, G. El-Haddad, C.H. Park, T.M. Beer, A. Armour, W.J. Pérez-Contreras, M. DeSilvio, E. Kpamegan, G. Gericke, R.A. Messmann, M.J. Morris, and B.J. Krause, for the VISION Investigators\*

Published  
6/23/2021

FDA approved  
3/23/2022

Supply chain issues  
5/5/2022

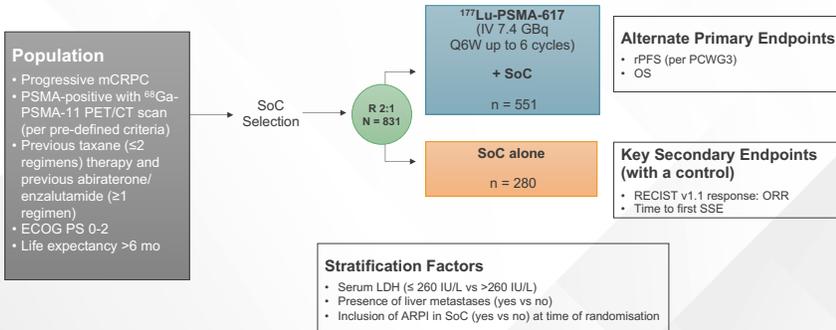

Resumed  
6/30/22

FDA, U.S. Food and Drug Administration.  
Sartor et al. *N Engl J Med.* 2021;385(12):1091-1103.

► Now, we now are going to go on to the phase 3 trial called the VISION trial. I was the co-PI, along with Bernd Krause, whom I mentioned earlier from Germany, and this was published June 23rd, leading to an FDA approval on March 23rd of 2022. But I should also make note of some supply chain problems, that came in the United States on May 5th. So, it's not all perfect here.

## VISION: <sup>177</sup>Lu-PSMA-617 Phase 3 Trial Study Design

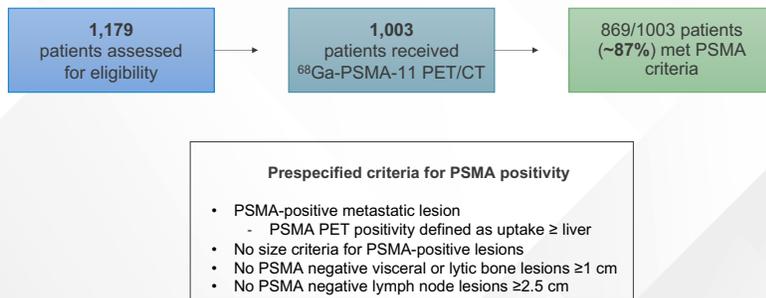

<sup>68</sup>Ga, gallium-68; <sup>177</sup>Lu, lutetium-177; ARPI, androgen receptor pathway inhibition; CT, computed tomography; ECOG PS, Eastern Cooperative Oncology Group performance status; LDH, lactate dehydrogenase; mCRPC, metastatic castration-resistant prostate cancer; ORR, overall response rate; OS, overall survival; PCWG3, Prostate Cancer Working Group 3; PET, positron emission tomography; PSMA, prostate-specific membrane antigen; rPFS, radiographic progression-free survival; SoC, standard of care; SSE, symptomatic skeletal event.

► Let's discuss the VISION trial, and how it was designed and what patients were included. First of all, everybody had to have metastatic CRPC by conventional imaging, and it had to be progressive. There had to be PSMA PET positivity with a gallium-68 PSMA-11 PET scan, and I'll come back to that in a second. There had to be treatment with at least 1 prior taxane, but up to 2, and at least 1 prior novel hormone, such as abiraterone and enzalutamide, and an ECOG performance status of 0 to 2, and a life expectancy of 6 months or more.

The patients were randomized, 2 to 1, to receive the lutetium plus standard of care, or standard of care alone. And the standard of care selection was prespecified by the investigators. By the way, I should mention, this was a protocol-specified standard of care, and typically would consist of either abiraterone or enzalutamide, despite the prior exposure. There were alternate primary end points of rPFS and OS—radiographic progression-free survival—and a variety of secondary events as well, and then a variety of stratification factors.

## VISION Trial: Patient Selection with PSMA PET

► So, if we look at the selection by PSMA PET, there were 1,179 patients assessed for eligibility, and 1,003 patients got the gallium-68 PSMA-11 PET scan. Of these patients, 87% met the PSMA PET criteria. And what did that mean? They had to have a PSMA PET-positive metastatic lesion, with uptake greater than liver, and there was no size criteria for the PSMA PET positivity. They could have no PSMA-negative, visceral, or lytic bone lesions greater than a centimeter. So, remember there's a CAT scan also being done.

If you had a liver lesion that was 1.5 centimeters, and on PSMA PET that was cold, then that meant less than liver, what you really needed to do was to exclude that patient, and the same thing was true for the lytic bone lesions, the same thing is true for PSMA-negative lymph node lesions greater than 2.5 centimeters. So very importantly, not only were patients chosen by PSMA PET, they were excluded if they were PSMA PET-negative and the CT scan showed a lesion.

## VISION Trial: Logistical Issues

- Shortly after accrual began, dropout problems immediately evident in control group among certain sites
  - Sites where nuclear medicine doctors were leading the trial
- Patients disappointed not to be receiving  $^{177}\text{Lu}$ -PSMA
- Sites were closed, remaining sites further educated, the FDA consulted, and statistics reassessed

► Now, shortly after accrual began, dropout problems were immediately evident on the control side. So, it's typically in sites where nuclear medicine docs were leading the trial. Patients were disappointed not to be receiving the PSMA lutetium, and it actually turned into a bit of a mess. Sites had to be closed. The remaining sites were educated more. The FDA was consulted, and the statistics had to be reassessed.

## VISION Trial: Baseline Patient Characteristics

Characteristic	Analysis Set for Imaging-Based Progression-free Survival (N = 581)		All Patients Who Underwent Randomization (N = 831)	
	<sup>177</sup> Lu-PSMA-617 plus Standard Care (N = 335)	Standard Care Alone (N = 196)	<sup>177</sup> Lu-PSMA-617 plus Standard Care (N = 551)	Standard Care Alone (N = 280)
Previous prostatectomy – no. (%)	159 (41.3)	82 (41.8)	240 (43.6)	130 (46.4)
Previous androgen-receptor–pathway inhibitor – no. (%)				
One regimen	213 (55.3)	98 (50.0)	298 (54.1)	128 (45.7)
Two regimens	150 (39.0)	86 (43.9)	213 (38.7)	128 (45.7)
More than two regimens	22 (5.7)	12 (6.1)	40 (7.3)	24 (8.6)
Previous taxane therapy – no. (%)				
One regimen	207 (53.8)	102 (52.0)	325 (59.0)	156 (55.7)
Two regimens	173 (44.9)	92 (46.9)	220 (39.9)	122 (43.6)
Docetaxel	377 (97.9)	191 (97.4)	534 (96.9)	273 (97.5)
Cabazitaxel	161 (41.8)	84 (42.9)	209 (37.9)	107 (38.2)

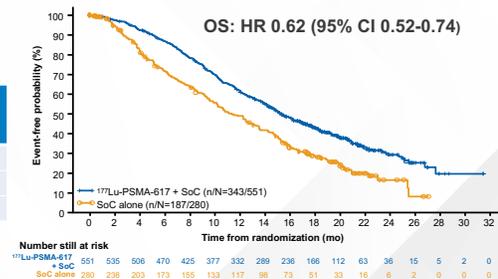

<sup>177</sup>Lu-PSMA-617, lutetium-177–prostate-specific membrane antigen 617. Sartor et al. *N Engl J Med*. 2021;385:1091-1103.

► And what this turns out—and if you go to the literature and you look at *The New England Journal*—what you see is two sets of patients. All of the patients who were randomized, and then a subsequent analysis for an image-based progression-free survival subset. All patients are 831, and the progression-free survival subset was 581. So, two different sets of patients, but for survival, it was really critical to do the intent-to-treat. And you can see here, these patients were heavily pretreated. Many of the patients had had 2 or even more than 2 regimens of androgen receptor pathway inhibitors—abiraterone, enzalutamide, apalutamide, et cetera. Around 40% of the patients had 2 regimens of taxane-based chemotherapy, and the second taxane was almost always cabazitaxel. So, these are very, very heavily pretreated patients.

## VISION Trial: Primary Efficacy Outcomes Imaging-based OS

VISION met both primary endpoints of OS and rPFS

	<sup>177</sup> Lu-PSMA-617 + SoC (n = 551)	SoC alone (n = 280)
Median OS, mo	15.3	11.3
HR (95% CI)	0.62 (0.52-0.74)	
P, one-sided	<.001	

Note: OS positive (HR 0.63) in rPFS subset and rPFS positive (HR 0.43) in OS subset

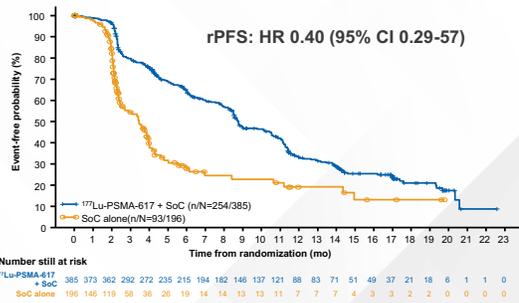

<sup>177</sup>Lu-PSMA-617, lutetium-177–prostate-specific membrane antigen 617; OS, overall survival; PSMA, prostate-specific membrane antigen; rPFS, radiographic progression-free survival; SoC, standard of care. Sartor et al. *N Engl J Med*. 2021;385:1091-1103.

► Now, what was found? Remember, there are 2 primary endpoints. Primary endpoint number 1 is overall survival. Hazard ratio of 0.62. Confidence intervals not even close to 1—0.52 to 0.74.

# VISION Trial: Primary Efficacy Outcomes Imaging-based PFS

VISION met both primary endpoints of OS and rPFS

	<sup>177</sup> Lu-PSMA-617 + SoC (n = 385)	SoC alone (n = 186)
Median rPFS, mo	8.7	3.4
HR (95% CI)	0.40 (0.29-0.57)	
P, one-sided	<.001	

Note: OS positive (HR 0.63) in rPFS subset and rPFS positive (HR 0.43) in OS subset

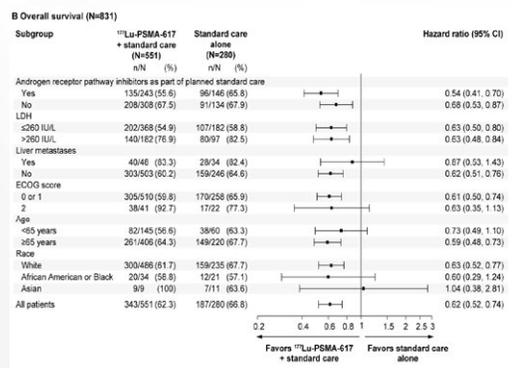

<sup>177</sup>Lu-PSMA-617, Lutetium-177-prostate-specific membrane antigen 617; OS, overall survival; PSMA, prostate-specific membrane antigen; rPFS, radiographic progression-free survival; SoC, standard of care. Sartor et al. *N Engl J Med*. 2021;385:1091-1103.

► The radiographic progression-free survival, and this was by criteria that was specified by the prostate cancer working group 2 and 3. The hazard ratio was 0.4. A positive trial on either endpoint.

And by the way, if you look at the overall survival in that smaller rPFS subset, it's positive, with a hazard ratio of 0.63. And if you look at the rPFS in the overall survival subset, with this large group of patients, you still end up positive. So, it doesn't matter how you slice and dice the data. This is a positive trial.

# VISION Trial: Prespecified Subgroup Analyses of Imaging-based PFS and OS

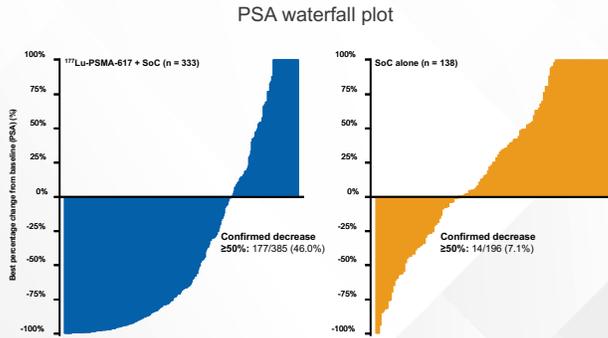

<sup>177</sup>Lu-PSMA-617, Lutetium-177-prostate-specific membrane antigen 617; LDH, lactate dehydrogenase; ECOG PS, Eastern Cooperative Oncology Group performance status; PFS, progression-free survival; OS, overall survival. Sartor et al. *N Engl J Med*. 2021;385:1091-1103.

► Now when you look at overall survival, this is the Forest plot, and what you can see is by far the majority of the points are to the left of the 1.0 line, meaning they favored lutetium PSMA-617, but certain subsets were smaller, and not able to be fully analyzed. You know, you can see the confidence intervals were large when the number of patients in the treatment group were small. But, for instance, liver metastases, the hazard ratio was 0.87—not quite as good as those who had no liver metastasis. If you look at those less than age 65, it's a smaller subset. Hazard ratio of 0.73 is good. 0.59 in those more than 65 years old, or age 65.

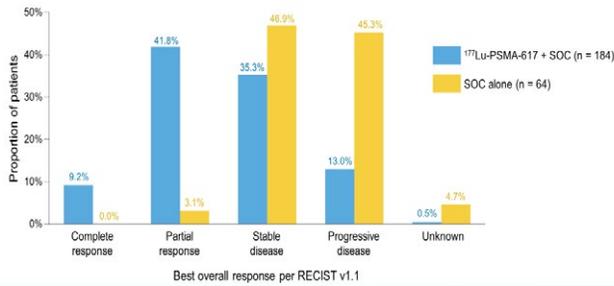

The Asian population was extremely small—only 20 patients. But there you can see that the hazard ratio is 1.04. I do not believe that is any relationship to lack of effect in Asians. I think it's just not poorly studied in the Asian population. Nevertheless, you can see that there is an overall survival benefit for all patients and most of the subsets clearly trend in the strong right direction.

## VISION Trial: Prostate-Specific Antigen Responses

► For PSMA declines, as shown here on the PSA Waterfall plot, you can see PSA declines of more than 50% in 46% of the patients. Remember, this is not a therapy population. These patients all had cabazitaxel. The TheraP randomized trial was randomized with cabazitaxel and no prior pretreatments. These were a different group of patients, and you have to be clear about that. In the control group here, 7.1% of the patients had a PSA decline of 50% or more. There was also tumor shrinkage.

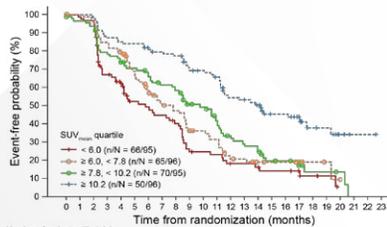

## Secondary Endpoint: RECIST v1.1 Responses Favored the $^{177}\text{Lu-PSMA-617}$ Arm in Patients with Measurable Disease

► This was presented at ASCO by Michael Morris, and you can see that the CR rate for those receiving lutetium was about 9.2%, the PR rate about 41.8—added together, about 50% of the patients that were assessable actually had a decrease in their measurable disease by criteria dictated from RESIST.

## rPFS by Whole-body SUVmean Quartiles (PFS-FAS)

Higher whole-body SUV<sub>mean</sub> was associated with prolonged rPFS

Number of patients still at risk

$\ge 10.2$	98	95	94	82	89	79	74	72	70	61	58	54	41	40	36	25	25	19	11	10	3	1	0
$\ge 7.8, < 10.2$	95	90	87	73	69	63	60	53	51	43	39	31	23	20	17	11	9	6	4	4	2	0	0
$\ge 6.0, < 7.8$	98	94	91	79	75	57	47	38	34	28	24	21	13	12	9	6	6	7	3	2	1	0	0
$< 6.0$	95	91	87	56	50	35	33	26	17	15	14	10	10	9	7	5	3	2	0	0	0	0	0

SUV <sub>mean</sub> quartile	Median rPFS (mo)
$\ge 10.2$ (highest)	14.1
$\ge 7.8, < 10.2$	9.8
$\ge 6.0, < 7.8$	7.8
$< 6.0$ (lowest)	5.8

SUV <sub>mean</sub>	rPFS
	HR [95% CI], P
Univariate analysis	0.88 [0.84-0.91], <.001
Multivariate analysis	0.86 [0.82-0.90], <.001

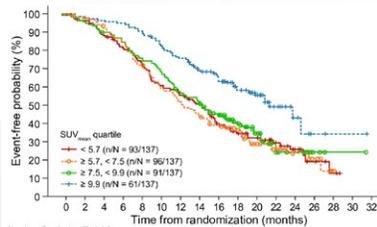

► Now, one of the things that's interesting is that when you look at whole body SUV mean, and this is looking at totality of the tumor uptake, that there is a pretty good correlation between the higher PSMA uptake—and this is by the PSMA PET scan—and the rPFS.

PFS-FAS, progression-free survival-full analysis set; rPFS, radiographic progression-free survival; SUV, standardized uptake value. Kuo et al. *J Clin Oncol*. 2022;40:5002.

## OS by Whole-body SUVmean Quartiles (FAS)

Higher whole-body SUV<sub>mean</sub> was associated with improved OS

Number of patients still at risk

$\ge 9.9$	137	135	132	123	124	116	104	91	79	56	37	17	6	2	1	1	0
$\ge 7.5, < 9.9$	137	132	123	118	104	85	79	71	57	41	28	13	5	3	1	1	0
$\ge 5.7, < 7.5$	137	136	128	112	107	92	71	61	50	34	20	10	5	1	0	0	0
$< 5.7$	137	130	121	108	98	82	70	64	48	34	27	18	12	5	2	0	0

SUV <sub>mean</sub> quartile	Median OS (mo)
$\ge 9.9$ (highest)	21.4
$\ge 7.5, < 9.9$	14.6
$\ge 5.7, < 7.5$	12.6
$< 5.7$ (lowest)	14.5

SUV <sub>mean</sub>	OS
	HR [95% CI], P
Univariate analysis	0.92 [0.89-0.95], <.001
Multivariate analysis	0.88 [0.84-0.91], <.001

► But if we look at the overall survival, the groups that were a little less avid by the SUV mean—remember, this is PSMA-11 SUV mean—that these were all pretty similar, whereas the highest quartile did extremely well, the median overall survival being 21.4 months for those with the highest PSMA uptake.

FAS, full-analysis set; OS, overall survival; SUV, standardized uptake value. Kuo et al. *J Clin Oncol*. 2022;40:5002.

## VISION Trial: Adverse Events

TEAEs Occurring in ≥5% of Patients, n (%)	Safety Set (N = 734)			
	All Grades		Grade 3-5	
	<sup>177</sup> Lu-PSMA-617 + SoC (n = 529)	SoC alone (n = 205)	<sup>177</sup> Lu-PSMA-617 + SoC (n = 529)	SoC alone (n = 205)
Fatigue	228 (43.1)	47 (22.9)	31 (5.9)	3 (1.5)
Dry mouth	205 (38.8)	1 (0.5)	0	0
Nausea	187 (35.3)	34 (16.6)	7 (1.3)	1 (0.5)
Anaemia	168 (31.8)	27 (13.2)	68 (12.9)	10 (4.9)
Back pain	124 (23.4)	30 (14.6)	17 (3.2)	7 (3.4)
Arthralgia	118 (22.3)	26 (12.7)	6 (1.1)	1 (0.5)
Decreased appetite	112 (21.2)	30 (14.6)	10 (1.9)	1 (0.5)
Constipation	107 (20.2)	23 (11.2)	6 (1.1)	1 (0.5)
Diarrhea	100 (18.9)	6 (2.9)	4 (0.8)	1 (0.5)
Vomiting	100 (18.9)	13 (6.3)	5 (0.9)	1 (0.5)
Thrombocytopenia	91 (17.2)	9 (4.4)	42 (7.9)	2 (1.0)
Lymphopaenia	75 (14.2)	8 (3.9)	41 (7.8)	1 (0.5)
Leukopaenia	66 (12.5)	4 (2.0)	13 (2.5)	1 (0.5)

<sup>177</sup>Lu-PSMA-617, Lutetium-177–prostate-specific membrane antigen 617; SoC, standard of care; TEAEs, treatment-emergent adverse effects. Sartor et al. *N Engl J Med*. 2021;385:1091-1103.

► If we look at the side effects from VISION—fatigue, dry mouth, nausea, some anemia, back pain and arthralgias—but please remember that the patients were observed for a longer time on the lutetium. They were alive longer, and took longer to progress, so some of these differences may be, in part, due to the fact that patients were followed for a longer period of time. Nevertheless, dry mouth is an unequivocal side effect from PSMA lutetium. Some of these patients can have nausea. Some can get anemia, some can be fatigued, and these are things that we need to be concerned about when treating our patients, as well as some thrombocytopenia.

## What We Know From VISION

- <sup>177</sup>Lu-PSMA-617 is effective and well tolerated in heavily pretreated mCRPC
- The trial would have been positive without patient selection using PSMA PET
  - OS HR 0.62 (95% CI 0.52-0.74)
- Nuclear medicine sites not well partnered with oncology had difficulty managing the control group in this randomized trial
  - Multidisciplinary care is **required!!!**
- This therapy will be adopted rapidly after regulatory approvals and will be used earlier in the treatment paradigm
- March 2022: FDA approved lutetium-177 vipivotide tetraxetan for the treatment of adult patients with PSMA-positive mCRPC who have been treated with androgen receptor pathway inhibition and taxane-based chemotherapy

<sup>177</sup>Lu-PSMA-617, Lutetium-177–prostate-specific membrane antigen 617; FDA, US Food & Drug Administration; mCRPC, metastatic castration-resistant prostate cancer; OS, overall survival; PET, positron emission tomography; PSMA, prostate-specific membrane antigen; SoC, standard of care.

► Now, what do we know from VISION? We know that PSMA lutetium-617 is effective and well-tolerated in heavily pretreated patients. We know that, in all likelihood, the trial would have been positive, even without PSMA PET selection. We also know that nuclear medicine sites, not well-partnered with oncology, had difficulty managing the control group, and I believe that multidisciplinary care is required. This therapy will be rapidly adopted after regulatory approvals, and we have that now, and likely it will move earlier into the treatment paradigm, and there are trials looking at that now.

## What We Do Not Know From VISION

- What is the optimal patient selection criteria when using PSMA PET? FDG PET?
- What is the optimal dose and schedule for this therapy?
- What is the relationship between PSA progression and/or response and survival benefit?
  - Extremely good!!!
- Can re-treatment at progression make a positive impact?
- Does treatment with “SoC” + <sup>177</sup>Lu-PSMA-617 add to that of the isotope alone?
- What about trials in the pre-chemotherapy space?
- What type of therapies might be synergistically combined with this therapy?

► Now what do we not know from VISION? I don't think we know yet the optimal PSMA PET selection criteria. We don't really know if FDG/PET should be used. Interestingly, we don't know the optimal dose and schedule for this therapy. We don't fully understand the relationship between PSA progression, PSA response, and survival. But I'm telling you, preliminary data look fairly good – wait till ESMO. We don't know anything about retreatment at progression. We don't know about standard of care, and to what extent standard of care really adds to the PSMA of lutetium. It did look a little better for those being treated with the combination of – of the advanced hormonal agents plus lutetium, as compared to lutetium alone, but that is a conjectural statement, not a definitive statement.

► We have trials that are ongoing in the pre-chemo space, but we don't know about that space yet. We don't know a lot about how we can combine this set of trials. Now we do have some important trials in the metastatic CRPC setting. PSMAfore, SPLASH and ECLIPSe are all looking at metastatic CRPC, PSMA PET-positive patients who are going to be getting PSMA lutetium versus a second-line hormonal agent, and all of these trials are in accrual right now.

We also know that there is a trial called PSMAddition. And this is a prospective open-label study, looking at hormone-sensitive prostate cancer standard of care versus the PSMA lutetium plus standard of care. Very, very important trial for metastatic, hormone-sensitive patients, and this trial is now ongoing.

<sup>177</sup>Lu-PSMA-617, lutetium-177-prostate-specific membrane antigen 617; FDG, fluorodeoxyglucose; PET, positron emission tomography; PSA, prostate-specific antigen; SoC, standard of care.

## New Important Trials in Metastatic Prostate Cancers

Trial Name	Phase	Prostate Cancer Type	Details
PSMAfore	3	mCRPC	Open-label, Multi-Center, Randomized Study Comparing <sup>177</sup> Lu-PSMA-617 vs. a Change of Androgen Receptor-directed Therapy in the Treatment of Taxane Naïve Men With Progressive mCRPC
SPLASH	3	mCRPC	Open-Label, Randomized Study Evaluating Metastatic Castrate Resistant Prostate Cancer Treatment Using PSMA [Lu-177]-PNT2002 Therapy After Second-line Hormonal Treatment
ECLIPSe	3	mCRPC	Open-Label, Multi-Center, Randomized Trial Comparing the Safety and Efficacy of <sup>177</sup> Lu-PSMA-I&T Versus Hormone Therapy in Patients With mCRPC
PSMAddition	3	mHSPC	International Prospective Open-label, Randomized, Study Comparing <sup>177</sup> Lu-PSMA-617 in Combination With SoC, Versus SoC Alone, in mHSPC

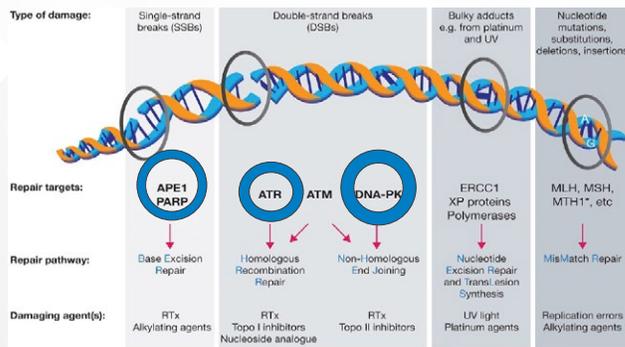

<sup>177</sup>Lu-PSMA-617, lutetium-177-prostate-specific membrane antigen 617; mHSPC, metastatic hormone-sensitive prostate cancer; mCRPC, metastatic castration-resistant prostate cancer; SoC, standard of care.

# Synergistic Opportunities for Radiopharmaceuticals

- ▶ We have many questions about synergistic opportunities for radiopharmaceuticals.

## Targeting DNA Damage Repair Pathways in Combination With Radionuclides

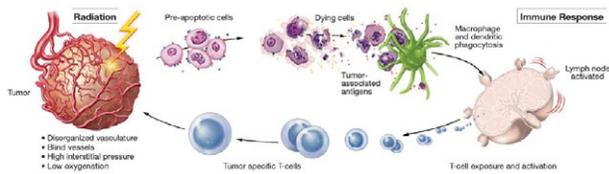

- ▶ Number 1, since the lutetium and other radiopharmaceuticals damage DNA, what would happen if you inhibited DNA repair pathways? What about a PARP inhibitor, an ATR inhibitor, an ATM inhibitor, or a DNA-P kinase inhibitor? And we really don't know about synergy in this setting. We think that there could be synergy, and there are now phase 1 studies that are ongoing with the PARP inhibitors, in particular, in combination with PSMA lutetium.

APE1, AP endonuclease 1; ATM, ataxia-telangiectasia mutated; ATR, ataxia-telangiectasia and Rad3-related; DNA-PK, DNA-dependent protein kinase; PARP, poly(ADP-ribose) polymerase; RTx, radiotherapy; Topo, topoisomerase; UV, ultraviolet. O'Connor, Mol Cell 2015;60:547-560.

## Antigen Release From Radiated Tumor: Synergy With Immunotherapies?

### Systemic/local immune enhancement

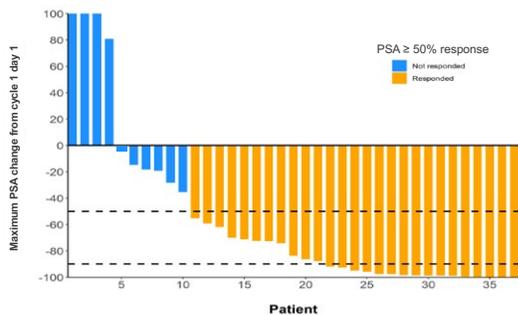

- Vaccine
- Checkpoint Inhibitors
  - Anti-CTLA-4
  - Anti-PD-L1
  - Anti-PD-1
  - Anti-TIM3
- Co-stimulatory agonists
  - Anti-OX40
  - Anti-4-1BB
  - Anti-GITR
  - Anti-CD27
  - Anti-CD40
- Exogenous Cytokines
  - IL-2
  - IL-7
  - IL-12
  - IL-15
  - IL-21
  - GM-CSF

► There is also a question about antigen release from radiated tumors, and potential synergy with immunotherapy.

CTLA, cytotoxic T-lymphocyte-associated antigen; GM-CSF, granulocyte-macrophage colony-stimulating factor; IL, interleukin; PD-1, programmed cell death protein 1; PD-L1, programmed cell death protein ligand 1. Kamrava et al. *Mol Biosyst* 2009;5:1249-1372.

## Waterfall Plot for PSA Declines on PRINCE Trial: <sup>177</sup>Lu-PSMA-617 + Pembrolizumab

This may be selection bias

► As it turns out, that there are initial reports that look at the combination of PSMA lutetium and pembrolizumab, a PD-1 inhibitor in immunotherapy, but we don't really have comparative data, and I'm not willing to say at this point that this is better than PSMA lutetium alone. It's certainly better than pembrolizumab alone, but there could be some selection bias in the way the patients were chosen. So, small phase 2s always have to be interpreted with caution.

<sup>177</sup>Lu-PSMA-617, lutetium-177-prostate-specific membrane antigen 617; PSA, prostate-specific antigen. Sandhu et al. *Ann Oncol*. 2021;32:S626-S677.

## What About PSMA Radiopharmaceutical Studies With Ligands Other Than PSMA-617?

- Antibodies
  - J591 anti-PSMA antibody with  $^{177}\text{Lu}$  and  $^{225}\text{Ac}$
  - PSMA-directed antibody (PSMA TTC): phase 1 with  $^{227}\text{Th}$
- Small molecules
  - PSMA I&T: two phase 3 trials with  $^{177}\text{Lu}$
  - PSMA I&T with  $^{225}\text{Ac}$
  - PSMA-R2: phase 1 trial with  $^{177}\text{Lu}$
  - MIP-1095: phase 2 trial with  $^{131}\text{I}$
  - SAR-PSMA entering phase 1 trial with  $^{67}\text{Cu}$
  - ITM-22 with  $^{225}\text{Ac}$  in phase 1 trial
  - NG001 with  $^{212}\text{Pb}$  about to enter the clinic
  - And more.....

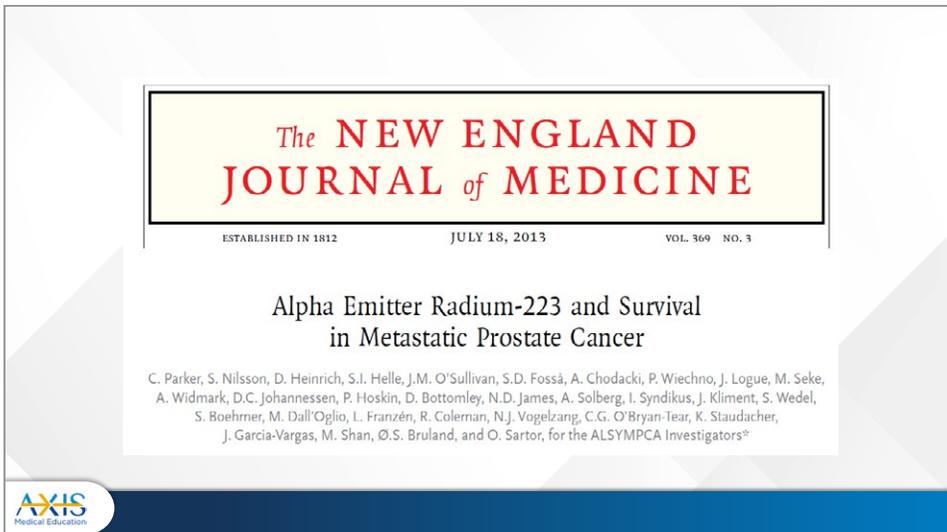

$^{177}\text{Lu}$ -PSMA-617, lutetium-177-prostate-specific membrane antigen 617;  $^{212}\text{Pb}$ , lead-212;  $^{225}\text{Ac}$ , actinium-225; I&T, imaging and therapy; PSA, prostate-specific antigen; PSMA, prostate-specific membrane antigen.

► Now, what about PSMA radiopharmaceutical studies with ligands other than PSMA-617? I mentioned the ECLIPSE trial and the SPLASH trial. Those are being conducted with PSMA I&T. But they're also antibodies, such as J591, and another antibody called PSMA-TTC, that have been looked at in phase 1. And then, in addition to PSMA I&T, there are also other small molecules, such as R2, 1095, an agent called SAR-PSMA, or ITM22 and NG001, and there are a variety of isotopes. And so, this is an interesting and rapidly evolving space.

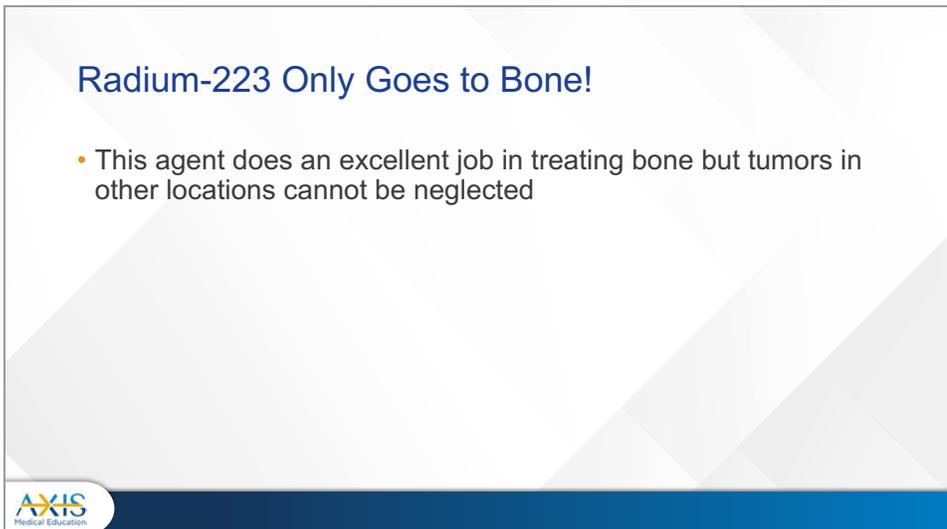

## Alphas

► Now it turns out that Dr. Kendi had mentioned the alpha particles. I also wanted to mention alphas.

▶ This harkens back to the use of radium-223, which can prolong survival in metastatic prostate cancer, but here you're targeting only the bone.

▶ And because radium only goes to bone, the tumors in the other locations cannot be neglected. Yet, that's what we have with radium therapy alone.

# Alphas

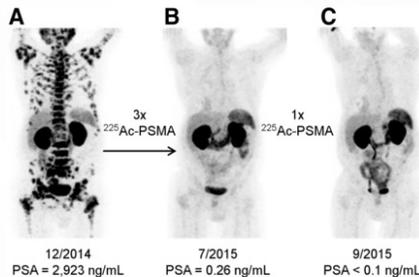

Radionuclide	Chelate	Half life	Total alpha	"Long lived" Intermediate	Final
Terbium-149	DOTA	4.1 hours	1 alpha		Nd-145
Astatine-211	Various	7.2 hours	1 alpha		Pb-207
Bismuth-212	C-DEPA/ DTPA/DOA	61 minutes	1 alpha 1 beta		Pb-208
Lead-212	TCMC and more	10.6 hours	1 alpha 2 beta		Pb-208
Bismuth-213	C-DEPA/ DTPA/DOA	46 minutes	1 alpha 2 beta		Bi-209
Radium-224	None	3.6 days	4 alpha	Lead-212	Pb-208
Actinium-225	DOTA and more	10.0 days	4 alpha 2 beta	Bismuth-213	Bi-209
Radium-223	None	11.4 days	4 alpha 2 beta		Pb-207
Thorium-227	DOTA	18.7 days	5 alpha	Radium-223	Pb-207

► Now, there are a whole series of alphas that are under investigation. Dr. Kendi had mentioned actinium-225, and that's one of my favorites as well. We've also done studies with thorium-227. By the way, radium-223 is very, very difficult to chelate, so we don't have a way of chelating radium at this time. But there are studies that are being planned with lead-212. There's studies that have been performed with bismuth-212. Terbium-149 and astatine-211 are also of potential interest.

## Radio-Conjugates: PSMA-Targeted Alpha Emitters (Actinium-225) as Ninth-Line Treatment

Patient A
Leuprorelin
Zoledronate
Docetaxel (50 cycles)
Carmustine/epirubicin in hyperthermia
Abiraterone
Enzalutamide
<sup>223</sup> Ra (6 cycles)
Abiraterone reexposition
Estramustine

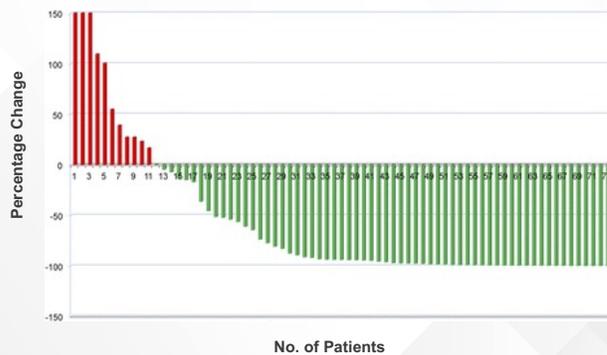

► Now, it turns out that PSMA-targeted alpha therapy, with actinium-225 and here is PSMA-617, has the capacity to be very, very active in a subset of patients, but salivary gland toxicity has been rate limiting.

<sup>225</sup>Ac-PSMA, actinium-225–prostate-specific membrane antigen; <sup>223</sup>Ra, radium-223; PSA, prostate-specific antigen. Kratochwil et al. *J Nucl Med*. 2016;57:1-4.

## Percentage Change in PSA After $^{225}\text{Ac}$ -PSMA-617

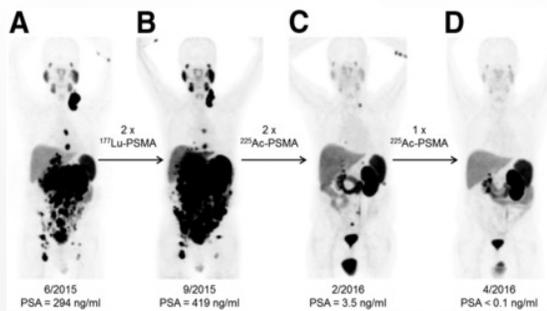

► There is also data from South Africa, and this is from University of Pretoria by Dr. Mike Sathekge, looking at the actinium-225, PSMA-617. It is highly active but again, there's some salivary issues, and these were not necessarily refractory patients. These were patients who may not have previously received chemotherapy or novel hormones.

$^{225}\text{Ac}$ -PSMA 617, actinium-225-prostate-specific membrane antigen; PSA, prostate-specific antigen. Sathekge et al. *J Nucl Med.* 2020;61:62-69.

## Alpha Post-Beta Failure

► There was a mention of alphas post-beta failure, and here's an example from the German group at Heidelberg, using alphas after therapy had failed with PSMA lutetium, and getting an excellent response.

$^{177}\text{Lu}$ -PSMA-617, lutetium-177-prostate-specific membrane antigen 617;  $^{225}\text{Ac}$ -PSMA, actinium-225-prostate-specific membrane antigen; PSA, prostate-specific antigen. Kralochvil et al. *J Nucl Med.* 2016;57:1-4.

## Current “Combination” Explorations

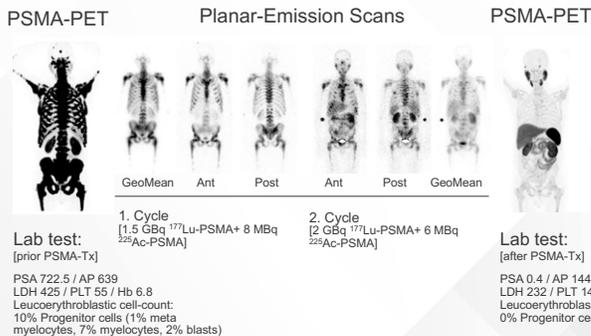

- Isotopes: Alphas and Betas in combination
- Isotopes and various hormonal therapies
  - Novartis “mHSPC” phase 3 trial
- Isotopes and PARPi and other inhibitors of DNA repair
- Isotopes and high-dose testosterone
- Isotopes and 5-FU infusion low dose (radiosensitizer)
- Isotopes and immunotherapy (anti-PD-1, etc)

► And looking at combinations, which was also mentioned by Dr. Kendi. Alphas and betas in combinations, isotopes in various hormonal combinations, PARP inhibitors and other inhibitors of DNA repair. It’s been an interesting concept around isotopes and high-dose testosterone. Isotopes in 5-FU infusion, which is radiosensitizer. Isotopes in immunotherapy, which I mentioned. So, lots of ways to project this into the future.

5-FU, 5-fluorouracil; mHSPC, metastatic hormone-sensitive prostate cancer; PARPi, pol (ADP-ribose) polymerase inhibitor; PD-1, programmed cell death protein 1.

## Alpha/Beta Combo

► These alpha-beta combos are particularly interesting. Here, you can diminish the salivary damage, and hopefully provide some better effect than just the beta alone, but we need to think in more detail.

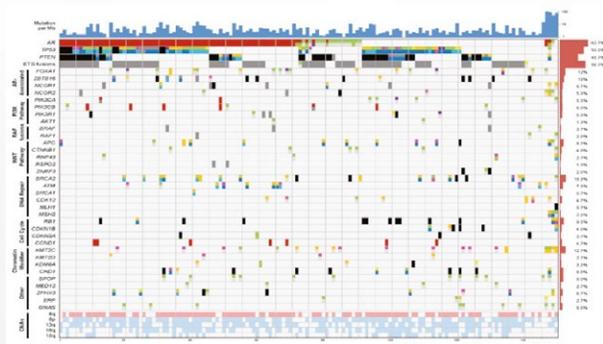

<sup>177</sup>Lu-PSMA-617, Lutetium-177-prostate-specific membrane antigen 617; <sup>225</sup>Ac-PSMA, actinium-225-prostate-specific membrane antigen; AP, alkaline phosphatase; Hb, hemoglobin; LDH, lactate dehydrogenase; PET, positron emission tomography; PLT, platelets; PSA, prostate-specific antigen; Tx, treatment. Kratochwil et al. Semin Nucl Med. 2020;50:133-140.

## Why Isotopes?

- Tremendous acceleration of drug development when you can see your target and the ratio of tumor uptake to non-tumor tissues
  - Imaging key!
- Ability to treat the “umbra and penumbra” around the area of “drug” deposition
  - The ability to overcome heterogeneity is key to success

▶ One of the things that I think needs to be addressed, is why isotopes? I think you can tremendously accelerate drug development when you can see your target and look at the ratio of tumor uptake to nontumor tissue. You can image your target, and then when you treat, it's not just the individual cell, but also what I call the umbra and penumbra—the area around the drug deposition site. This helps to overcome heterogeneity. When you use an isotope, you get into the tumor, and you can potentially kill the cell to which it binds, but you may also kill surrounding cells including the microenvironment in the stroma.

## Challenges: Metastatic Prostate Cancer Is a Heterogeneous Group of Diseases, but Radiation Can Kill Them All!

▶ Metastatic prostate cancer is a heterogeneous group of diseases, but radiation can kill them all, and that is one of the reasons why I've devoted a substantial portion of my own career to trying to improve patient care through the use of molecularly targeted radiation.

## FACULTY DISCUSSION

► **Dr. Sartor:** I might like to mention a case, that I think is quite interesting. As with any therapy, there are patients who do well, and patients who do less well. One of the more interesting patients I've seen and just completed three cycles of therapy with PSMA lutetium, was a patient who had a somatic *BRCA2* mutation, detected on his circulating tumor DNA. After his initial response, he had about a 90% decline in PSA, and after 2 treatments, he had a 99% decline in PSA, and it was now less than 1. As it turned out, we were looking at serial circulating tumor DNA markers. And what we could see was the disappearance of the *BRCA2* somatic clone. Now, we've all known that *BRCA2* mutations predispose to DNA damaging agents, and this type of therapy is going to be exploited with the use of things like carboplatin, cyclophosphamide. But now, we have clear evidence that lutetium-177 may be especially active in those individuals with *BRCA* mutations, which in turn predispose to damage from DNA-damaging agents. So, an interesting little vignette.

One of the things that I think is important is a team-based approach toward theranostics, when you're treating the advanced patient with prostate cancer. It turns out that advanced prostate cancer patients have many potential complications. They have issues with pain, anemia, thrombocytopenia, may have difficulty with bone metastasis, and as we have done at Tulane, I have found it most productive to work as a team with my colleagues, and I wonder if you might mention how that works at Mayo Clinic, because I know

that you guys have a fantastic team up there as well.

**Dr. Kendi:** Thank you, Dr. Sartor. I echo with what you mentioned, especially the care of the patients at advanced stages with multiple comorbidities. You have to have the teamwork at any point, but that is most important in this patient population, and at Mayo Clinic, since the start of VISION trial, we formed already a team that we are working together, collaborating together, and this is going on after FDA approval as well. This team includes people from nuclear medicine with dedicated interest to nuclear therapies. This includes people from urology, radiation oncology, and also team members from medical oncology, as well as, if needed, from surgery, nephrology and orthopedics, depending on patient's condition and the needs. And we decided to have biweekly meetings to discuss patients. In our initial few meetings, we decided to have presentations about the treatment, and we make our protocols together, and we decided to move forward everything together with this – within these meetings with decisions made together. And after that, now we are reviewing cases with that needs discussions in these meetings with our colleagues together. This meeting is led by nuclear medicine team, but everybody from all the other departments are joining; these patients need care from all of us, and it is not like a one-sided approach. It is just combination of all the expertise coming together with the patient in the centers.

For example, these patients

are coming after heavy treatments with other therapies. And with the chemotherapy and radiation therapy, immunotherapy, and we definitely look at the medications and recent history and we go through these in details. In addition, some of the patients – the burden of the disease can be concerning for possible fractures, or spinal canal compromise. We always review, we have some of our patients who needed extra review by orthopedics team to make sure we can proceed with the therapy and if needed to prevent any impending fractures, if there is any intervention is needed we get consults for these patients. In addition, sometimes lymph nodes and some of the pelvic disease may cause a urinary tract obstruction. You have to be careful about the kidney function as well as you should check the patency of the ureters, making sure there is no hydronephrosis. If there is hydronephrosis, you need to fix that with nephrostomy, or ureteral stent placement before moving with the treatment. These are a few things I wanted to mention.

**Dr. Sartor:** That's wonderful, and you're very fortunate to be able to have such a multidisciplinary team. And of course, I think we all know the reputation of Mayo Clinic and excellence in patient care, so thank you for sharing.

**Dr. Kendi:** Thank you so much, Dr. Sartor.

**Dr. Sartor:** Thank you very much.

### **About AXIS Medical Education, Inc.**

AXIS Medical Education, Inc. is a full-service continuing education company that designs and implements live, web-based, and print-based educational activities for healthcare professionals. AXIS provides convenient opportunities to engage learners based on their individual learning preferences through a full spectrum of educational offerings.

The executive leadership of AXIS combines 75 years of experience in adult learning theory, curriculum design/implementation/assessment, continuing education accreditation standards, and medical meeting planning and logistics. Our team has a deep understanding of the governing guidelines overseeing the medical education industry to ensure compliant delivery of all activities.

AXIS employs an experienced team of medical and scientific experts, medical writers, project managers, meeting planners, and logistics professionals. This team is dedicated to meeting the unmet educational needs of healthcare professionals, with the goal of improving patient outcomes.

AXIS believes that partnerships are crucial in our mission to deliver timely, relevant, and high-quality medical education to healthcare professionals. To that end, AXIS partners with other organizations and accredited providers to offer added expertise and assist in expanding access to our educational interventions. AXIS also partners with numerous patient advocacy organizations to provide recommended patient education and caregiver resources in specific disease areas. AXIS finds value in these partnerships because they complement our core clinical curriculum with validated and relevant supplemental resources for busy clinicians and their patients.

The mission of AXIS is to enhance the knowledge, skills, competence, and performance of the interprofessional healthcare team to ensure patients receive quality care, resulting in improved patient outcomes. We engage healthcare professionals in fair-balanced, scientifically rigorous, expert-led certified educational activities designed to foster lifelong learning that is applicable to clinical practice and patient-centered care.

To learn more and to see our current educational offerings, visit us online at [www.AXISMedEd.com](http://www.AXISMedEd.com).
